

Americrete – Trifold Brochure

Corporate Description and Two Products

Corporate Description

Americrete, Inc. is a company that strives for excellence. With over 75 years of expertise, we offer one of the most technologically advanced lines of concrete and asphalt renewal, restoration and protective products available. This is achieved by the advanced technology of polymers designed and blended to reduce the overall cost of resurfacing and far outlast any other product available.

Our products are easy to use, V.O.C. compliant, environmentally friendly and most are water based. We also offer a variety of water base stains, highly chemical and mar-resistant sealers, epoxies, urethanes and can introduce vinyl chips as a decorative finish.

Variances in geographical climates and weather conditions cause severe deterioration of surfaces subjected to freeze/thaw cycles, salt, chemicals, water and harsh ultraviolet rays. Americrete, Inc. products outperform all other surfacing products making it possible to restore degraded and delaminated surfaces with longer lasting results than available from any other product at any price.

AR-650CT

AR-650CT is a single component, cementitious product combined with a proprietary co-polymer and a large aggregate. The product can be easily applied in heavier layers that have exceptional strength and durability for long resurface life. This formulation does not have a self-leveler allowing build-up and form-following application without any requirement for milling beforehand. Mixed with only water, AR-650CT reaches tack-free state within 3-5 hours and full traffic capability within 8 to 12 hours. It has no V.O.C.'s and no strong odor permitting it to easily be used in populated areas. The applied surface is flexible, skid-resistant, non-hazardous, prevents surface degradation and resists both water and petroleum based fluids.

AR-650CT is Cal Trans approved for California Highways.

AR-1000

Americrete's AR-1000 Asphalt Sealer is the answer to today's need for fast application. The product can be applied to any good condition asphalt or concrete surface to completely seal and protect it, giving it a longer life. AR-1000 is highly recommended for parking lots or street surfaces where minimal disruption to traffic is required. Easily applied, it dries within 10 minutes and is available to traffic within only one to two hours.

AR-1000 is a water-based acrylic cross linked with oil resins to create a penetrating sealer for all surfaces. Black in color, the product penetrates deep into the substrate creating a breathable and durable semi-gloss seal. The resulting surface is very flexible yet is highly resistant to chemicals and water. For jobs big and small, AR-1000 can easily be applied by sprayer, roller or broom and the water-base allows for easy and fast cleanup. The sealer is environmentally safe, non-hazardous, without any strong odor and is the longest lasting sealer available today.
