

Once In A Lifetime

Providing effective treatments for Viral Diseases

Annually, thousands of men, women and children die as a result of viral infections. These diseases include hepatitis, influenza and hemorrhagic fever (such as dengue and ebola). Add to this the current estimate of 34 million people around the world infected with HIV and AIDS, the future looks bleak for children no matter what country they are from. And with the global mobility people have today, these diseases continue to spread around the world with alarming regularity.

A California pharmaceutical laboratory working on cures for viral diseases over the past 15 years now has an effective treatment for many viral infections that plague mankind worldwide. This patented treatment, derived from naturally

occurring compounds in the soil, has been tested by many groups including the renowned National Institutes of Health in Bethesda, Maryland. In testing, the product has been shown to stop and eliminate many viral infections from living tissue and blood. According to the NIH, it is effective at eliminating influenza A and B, Herpes Simplex 1 and 2, Ebola (and other hemorrhagic fever viruses) and the Epstein-Barr virus. In blood cultures and monkey kidney cells it was also found to eliminate HIV and AIDS virus infections. One fully documented human subject test showed elimination of the HIV virus within 90 days. Amazingly, the treatment was found to have zero toxicity as well.

“Once in a lifetime” may be an over-used catch-phrase, but it describes the opportunity the foundation has been given to help the world in its fight against many deadly diseases. Because of the costs and constant delays in the US when testing new treatments, the producer of the remedy needs human demonstrations of the product effectiveness. Through our work in Africa, we have found many people dying from viral diseases, with the biggest threat now being HIV/AIDS with an estimated 29 million infected. We have many willing subjects desperate for anything that may help them.

The foundation will be permitted to purchase the product at a very low cost directly from the pharmaceutical company for treating patients in Africa. We will be providing full therapeutic testing efforts with full documentation sent back to the company. Not only will this help the patients in Africa but, at the same time, American patients will benefit by the subsequent pressure on US government regulators to approve treatment for Americans because of demonstrated effectiveness and safety.

The fund raising target is \$5 million to accomplish large scale human testing of this product. The funds will allow us to purchase 10 million doses that should treat between 10,000 and 20,000 people over the course or the next 12 months. The target areas are Ghana, Zambia, Tanzania and South Africa where we have staff and contacts with medical personnel to conduct the tests.

This window of opportunity has been offered to the foundation with the understanding that funds can be raised quickly and we can get underway early in the year. Therefore, donations are needed immediately to begin this process as early in 2004 as possible.

The Serendipity International Foundation is a public charity operating as a non-profit entity under IRS section 501c3 rules providing tax deductibility for donations.
